Definition and Characteristics of Placental Mammals

Placental mammals, or eutherians, comprise the largest group within the class Mammalia. Their defining feature is the presence of a complex placenta—a specialized organ that facilitates nutrient, gas exchange, and waste removal between mother and fetus during gestation. Key Characteristics of Placental Mammals: - Placenta Development: A highly vascularized organ formed during pregnancy that connects the mother's blood supply to the developing fetus. - Extended Gestation: Longer developmental periods within the womb compared to monotremes and marsupials. - Live Birth: Most placental mammals give birth to live, relatively well-developed young. - Fetal Development: The fetus is nurtured within the uterus, receiving oxygen and nutrients directly through the placenta.

Developmental Features of the Fetal Pig as a Placental Mammal

The fetal pig exhibits hallmark features of placental mammals: - Placental Connection: The pig develops a chorioallantoic placenta,

which allows for efficient maternal-fetal exchange. - Amniotic Sac: The fetus is encased within an amniotic sac containing amniotic fluid, providing cushioning and a controlled environment. - Vascular Systems: The development of a complex circulatory system to support rapid growth and organogenesis.

Embryonic Development of the Fetal Pig
