Deep Dive into Key Quantitative Techniques

1. Linear Programming (LP)

Linear programming is a mathematical method for optimizing a linear objective function, subject to a set of linear inequalities or equations.

Applications in management:

1. Resource allocation
2. Production scheduling

3. Transportation and logistics optimization

Steps to solve LP problems:

1. Define decision variables
2. Formulate the objective function
3. Establish constraints
4. Graph the feasible region (for two variables)
5. Identify the optimal solution (corner point method)

Example:

A factory produces two products, A and B. The profit per unit is \$30 and \$20 respectively. The production process has limited resources, such as machine hours and raw materials. Using LP, management can determine the optimal quantity of each product to maximize profit within resource constraints.

1. Decision Analysis

Decision analysis involves evaluating different courses of action under uncertainty, often using tools like decision trees and expected value analysis.

Key components:

1. Alternatives
2. States of nature
3. Payoffs
4. Probabilities

Application:

Choosing investment projects, launching new products, or selecting suppliers where outcomes are uncertain.

1. Inventory Management

Effective inventory management minimizes costs while meeting customer demand.

Techniques include:

1. Economic Order Quantity (EOQ)
2. Reorder Point (ROP)
3. Safety stock calculations

EOQ Formula:

$$EOQ = \sqrt{\frac{2DS}{H}}$$

Where:

1. D = Demand rate
2. S = Ordering cost
3. H = Holding cost per unit

1. Forecasting Techniques

Forecasting predicts future business metrics based on historical data.

Common methods:

1. Moving averages
2. Exponential smoothing
3. Regression analysis

Example:

Forecasting sales for the upcoming quarter to plan production schedules.

1. Queuing Theory

Queuing theory analyzes waiting lines to improve service efficiency.

Applications:

1. Customer service centers
2. Manufacturing systems
3. Computer networks

Key metrics:

1. Average wait time
2. Queue length
3. Service capacity

1. Project Scheduling (PERT and CPM)

These techniques help manage complex projects by identifying critical activities and timelines.

Steps:

1. Define project activities
2. Determine dependencies
3. Estimate durations
4. Calculate critical path

Practical Application: Solving a Sample Problem

Let's explore a typical problem from the Quantitative Analysis for Management 11th Edition Solution:

Problem:

A company plans to produce two products, X and Y. The profit per unit is \$50 for X and \$40 for Y. The production process requires machine hours and raw materials, with the following constraints:

1. Machine hours available: 1,200 hours
2. Raw materials available: 800 units

The resource requirements:

Product	Machine hours per unit	Raw materials per unit
---------	------------------------	------------------------

--	--	--

X	3 hours	2 units
---	---------	---------

Y	2 hours	1 unit
---	---------	--------

Objective:

Maximize profit.

Solution Steps:

1. Define Decision Variables:
 1. Let x = number of units of Product X
 2. Let y = number of units of Product Y

1. Formulate Objective Function:

\[

\text{Maximize } Z = 50x + 40y

\]

1. Establish Constraints:

1. Machine hours: $(3x + 2y \leq 1200)$
2. Raw materials: $(2x + y \leq 800)$
3. Non-negativity: $(x, y \geq 0)$

1. Graphical Solution:

Plot constraints to identify feasible region, then evaluate corner points:

1. Intersection points of constraints
2. Boundaries where $(x = 0)$ or $(y = 0)$

1. Calculate Profit at Each Corner Point:

1. At (0,0): Profit = 0
2. At (0,400): $(3(0) + 2(400) = 800 \leq 1200)$, feasible; profit = $(50(0) + 40(400) = 16,000)$
3. At (300,0): $(3(300) + 2(0) = 900 > 1200)$, not feasible
4. At intersection point of constraints:

Solve $(3x + 2y = 1200)$ and $(2x + y = 800)$:

1. From second: $y = 800 - 2x$

2. Substitute into first:

$\backslash$

$$3x + 2(800 - 2x) = 1200 \implies 3x + 1600 - 4x = 1200 \implies -x = -400 \implies x = 400$$

$\backslash$

1. Then $y = 800 - 2(400) = 800 - 800 = 0$

Profit at (400,0): $50(400) + 40(0) = 20,000$

1. Determine Optimal Solution:

1. Check profit at feasible corner points:

2. (400,0): profit = \$20,000

3. (0,400): profit = \$16,000

4. (200,400): verify feasibility:

5. Machine hours: $3(200) + 2(400) = 600 + 800 = 1400 > 1200$, not feasible

6. Other points within feasible region yield lower profit.

Conclusion:

Producing 400 units of Product X and none of Y maximizes profit, with a profit of \$20,000.
