Fundamental Concepts in the Mechanics of Solids

Before diving into the mechanics of solids, it's essential to familiarize oneself with some basic concepts:

Stress and Strain

1. Stress: Internal force per unit area within a material, generated by externally applied loads. It is measured in units such as Pascals (Pa).

Types of stress include:

1. Normal stress: Acts perpendicular to the surface (tensile or compressive).
 2. Shear stress: Acts parallel to the surface.
1. Strain: The measure of deformation representing the displacement between particles in a material relative to a reference length. It is dimensionless or expressed as a percentage.

Elasticity and Plasticity

1. Elastic behavior: When a material deforms under load but returns to its original shape upon unloading.
2. Plastic behavior: Permanent deformation after a certain stress level is exceeded.

Mechanical Properties

Key properties that influence a material's behavior include:

1. Young's modulus (E): Measure of stiffness.
2. Poisson's ratio (ν): Ratio of transverse strain to axial strain.
3. Yield strength: Stress at which permanent deformation begins.
4. Ultimate tensile strength: Maximum stress a material can withstand before failure.
5. Ductility: Ability to deform plastically before fracture.

Types of Mechanical Loads on Solids

The behavior of a solid depends significantly on the nature of the applied load:

Axial Loads

$\backslash$

$$\nabla \cdot \sigma + \mathbf{f} = 0$$

$\backslash$

1. Moment equilibrium:

Ensures internal stresses balance external moments.

Compatibility Conditions

Ensure that strains are compatible with a continuous displacement field, avoiding impossible deformations.
