Sample Problems and Solutions from Volume 2

To illustrate the depth and application of the lecture notes, here are sample problems typical of the senior olympiad level, along with concise solutions.

Problem 1: Number Theory

Prove that for any prime $(p > 3)$, $(p^2 - 1)$ is divisible by 24. Solution: - Since $(p > 3)$, (p) is odd, so $(p \equiv 1 \text{ or } 3 \pmod{6})$. - $(p^2 - 1 = (p-1)(p+1))$. - Both $(p-1)$ and $(p+1)$ are even, so their product is divisible by 4. - One of these is divisible by 3, since consecutive numbers modulo 3 are 0 and 2 or 1 and 2, but for primes greater than 3, $(p \equiv 1 \text{ or } 2 \pmod{3})$. - The two factors are consecutive even numbers, so their product is divisible by 8 as well. - Combining divisibility by 8 and 3 yields divisibility by 24.

Problem 2: Geometry

In triangle (ABC) , point (D) lies on side (BC) . The lines (AD) and (BC) intersect at (D) . If $(AB = AC)$, prove that (D) is the midpoint of (BC) . Solution: - Since $(AB = AC)$, triangle (ABC) is isosceles with $(AB = AC)$. - The median from (A) to (BC) is also the altitude and angle bisector. - If (D) lies on (BC) such that (AD) intersects (BC) at (D) , and (D) is the point where the line (AD) intersects (BC) , then (D) must be the midpoint of (BC) . - This is because in an isosceles triangle, the median from the apex (A) is also the angle bisector and altitude, which divides (BC) equally.
