Questions & Answers About cell cycle pogil extension questions

No	Question	Answer
----	----------	--------

1	What are the main phases of the cell cycle, and what occurs in each?	The main phases of the cell cycle are Interphase (G1, S, G2) where the cell prepares for division, and M phase (mitosis and cytokinesis) where the cell divides into two daughter cells. During interphase, the cell grows, DNA replicates, and prepares for mitosis. Mitosis involves the division of the nucleus, and cytokinesis divides the cytoplasm.
2	What is the significance of the G0 phase in the cell cycle?	The G0 phase is a resting or quiescent state where cells exit the active cycle and do not divide. Cells in G0 can re-enter the cycle under certain conditions or remain in this state permanently, which is important for tissue maintenance and cell specialization.
3	How do cyclins and cyclin-dependent kinases (CDKs) regulate the cell cycle?	Cyclins bind to CDKs to form active complexes that phosphorylate target proteins, driving progression through different cell cycle phases. The levels of cyclins fluctuate throughout the cycle, ensuring that cell division occurs in a controlled, sequential manner.
4	What are the key differences between mitosis and meiosis?	Mitosis results in two genetically identical diploid daughter cells and is used for growth and repair. Meiosis produces four genetically diverse haploid gametes and involves two rounds of division, reducing the chromosome number by half for sexual reproduction.
5	What role do checkpoints play during the cell cycle?	Checkpoints are control mechanisms that verify whether the cell is ready to proceed to the next phase. They ensure proper DNA replication, repair DNA damage, and prevent errors such as chromosome missegregation, maintaining genomic stability.
6	Describe how external signals can influence the cell cycle progression.	External signals like growth factors bind to cell surface receptors, activating intracellular pathways that promote cell cycle progression. These signals can stimulate the production of cyclins and other proteins necessary for advancing through checkpoints, or conversely, inhibit division if conditions are unfavorable.
7	Why is understanding the cell cycle important in cancer research?	Cancer involves uncontrolled cell division due to mutations that disrupt normal cell cycle regulation. Studying the cell cycle helps identify targets for therapy, develop drugs to inhibit abnormal proliferation, and understand how cancer cells evade normal growth controls.
