Step-by-Step Solutions to Circuit Analysis Problems

Below are detailed approaches to typical problems, illustrating how to systematically analyze circuits.

Problem 1: Finding Equivalent Resistance in a Series-Parallel Circuit

Scenario: A circuit has three resistors: $R_1 = 100\Omega$, $R_2 = 200\Omega$, and $R_3 = 300\Omega$. R_1 and R_2 are in series, and their combination is in parallel with R_3 . Find the equivalent resistance. Solution: 1. Calculate series resistance of R_1 and R_2 : $R_{\text{series}} = R_1 + R_2 = 100\Omega + 200\Omega = 300\Omega$ 2. Calculate parallel resistance with R_3 : $1 / R_{\text{eq}} = 1 / R_{\text{series}} + 1 / R_3$ $1 / R_{\text{eq}} = 1 / 300\Omega + 1 / 300\Omega = 2 / 300\Omega$ $R_{\text{eq}} = 300\Omega / 2 = 150\Omega$ Result: The equivalent resistance is 150Ω .

Problem 2: Applying Ohm's Law to Find Current

Scenario: A 12V power supply is connected across a resistor of 240Ω . Find the current flowing through the resistor. Solution: Use Ohm's Law: $I = V / R = 12V / 240\Omega = 0.05A$ or 50mA Result: The current is 50mA.

Problem 3: Using Kirchhoff's Laws in a Series Circuit

Scenario: In a circuit with two resistors $R_1 = 100\Omega$ and $R_2 = 200\Omega$ connected in series to a 12V source, find the voltage drop across R_2 . Solution: 1. Total resistance: $R_{\text{total}} = R_1 + R_2 = 100\Omega + 200\Omega = 300\Omega$ 2. Calculate total current: $I_{\text{total}} = V / R_{\text{total}} = 12V / 300\Omega = 0.04A$ 3. Voltage drop across R_2 : $V_{R_2} = I \times R_2 = 0.04A \times 200\Omega = 8V$ Result: Voltage across R_2 is 8V.

Problem 4: Transient Response in an RC Circuit

Scenario: An RC circuit with $R = 1k\Omega$, $C = 1\mu F$ is initially uncharged. At $t=0$, the circuit is connected to a 10V source. Find the voltage across the capacitor at $t = 1ms$. Solution: 1. Time constant: $\tau = R \times C = 1,000\Omega \times 1 \times 10^{-6}F = 0.001s$ or 1ms 2. Voltage across capacitor at time t : $V_C(t) = V_{\text{source}} (1 - e^{-(t/\tau)})$ $V_C(1ms) = 10V \times (1 - e^{-(1ms/1ms)}) = 10V \times (1 - e^{-1}) \approx 10V \times (1 - 0.368) \approx 6.32V$ Result: Voltage across the capacitor at 1ms is approximately 6.32V.

Problem 5: AC Circuit Impedance Calculation

Scenario: An AC circuit has a resistor $R = 100\Omega$, an inductor $L = 50\text{mH}$, and a capacitor $C = 10\mu\text{F}$ connected in series to a 60Hz source. Calculate the total impedance. Solution: 1. Inductive reactance: $X_L = 2\pi fL = 2\pi \times 60\text{Hz} \times 50 \times 10^{-3}\text{H} \approx 18.85\Omega$ 2.

Capacitive reactance: $X_C = 1 / (2\pi fC) = 1 / (2\pi \times 60\text{Hz} \times 10 \times 10^{-6}\text{F}) \approx 265.26\Omega$ 3. Calculate impedance: $Z = R + j(X_L - X_C) = 100\Omega + j(18.85\Omega - 265.26\Omega) \approx 100\Omega - j246.41\Omega$ 4. Magnitude of impedance: $|Z| = \sqrt{R^2 + (X_L - X_C)^2} \approx \sqrt{100^2 + 246.41^2} \approx \sqrt{10,000 + 60,701} \approx 267.66\Omega$ Result: The total impedance magnitude is approximately 267.66Ω .

Practical Examples and Solutions

Example 1: Simple Series Circuit

Problem:

Calculate the current flowing through a series circuit with a 12 V battery and three resistors: $(R_1 = 2\,\Omega)$, $(R_2 = 4\,\Omega)$, and $(R_3 = 6\,\Omega)$.

Solution:

1. Step 1: Combine resistors in series:

$$R_{\text{total}} = R_1 + R_2 + R_3 = 2 + 4 + 6 = 12\,\Omega$$

1. Step 2: Apply Ohm's Law:

$$I = \frac{V}{R_{\text{total}}} = \frac{12\,\text{V}}{12\,\Omega} = 1\,\text{A}$$

1. Step 3: Find individual voltages:

1. $V_{R_1} = I \times R_1 = 1\,\text{A} \times 2\,\Omega = 2\,\text{V}$

2. $V_{R_2} = 1\,\text{A} \times 4\,\Omega = 4\,\text{V}$

3. $V_{R_3} = 1\,\text{A} \times 6\,\Omega = 6\,\text{V}$

Summary:

The current through the circuit is 1 A, with voltage drops corresponding to each resistor.

Example 2: Parallel Circuit with a Voltage Divider

Problem:

Determine the voltage across $R_2 = 10\,\text{k}\Omega$ in a voltage divider formed from a 15 V source and two resistors: $R_1 = 5\,\text{k}\Omega$ and $R_2 = 10\,\text{k}\Omega$.

Solution:

1. Step 1: Use voltage divider formula:

$$V_{R_2} = V_{\text{in}} \times \frac{R_2}{R_1 + R_2}$$

1. Step 2: Calculate:

$$V_{R_2} = 15 \text{ V} \times \frac{10 \text{ k}\Omega}{5 \text{ k}\Omega + 10 \text{ k}\Omega} = 15 \text{ V} \times \frac{10}{15} = 10 \text{ V}$$

Summary:

The voltage across (R_2) is 10 V.

Example 3: AC Circuit with Reactive Components

Problem:

In an AC circuit with a 60 Hz source, a resistor of 100Ω , an inductor of 0.5 H, and a capacitor of $20 \mu\text{F}$ are connected in series. Find the impedance (Z) , the current (I) if the source voltage is 120 V RMS, and the phase angle.

Solution:

1. Step 1: Calculate reactances:

1. Inductive reactance:

$$X_L = 2\pi f L = 2\pi \times 60 \times 0.5 \approx 188.5 \Omega$$

1. Capacitive reactance:

$$X_C = \frac{1}{2\pi f C} = \frac{1}{2\pi \times 60 \times 20 \times 10^{-6}} \approx 132.6 \Omega$$

1. Step 2: Find total impedance:

$$Z = R + j(X_L - X_C) = 100 + j(188.5 - 132.6) = 100 + j55.9 \Omega$$

1. Step 3: Calculate magnitude of (Z) :

$$|Z| = \sqrt{100^2 + 55.9^2} \approx \sqrt{10,000 + 3,125} \approx 113.4 \Omega$$

1. Step 4: Find current:

$$I = \frac{V_{\text{rms}}}{|Z|} = \frac{120\text{ V}}{113.4\text{ }\Omega} \approx 1.058\text{ A}$$

1. Step 5: Determine phase angle:

$$\theta = \arctan\left(\frac{55.9}{100}\right) \approx 29.2^\circ$$

Summary:

The circuit's impedance is approximately $113.4\text{ }\Omega$ with a phase angle of 29.2° , and the current is about 1.058 A lagging the voltage.
