Step-by-Step Usage Guide

Using the API 20NE system involves a series of carefully executed steps to ensure valid results. Here's a detailed overview:

1. Preparing the Bacterial Inoculum

1. Obtain a fresh bacterial culture grown on an appropriate medium (e.g., nutrient agar) for 24-48 hours.
2. Standardize the inoculum to match a specific turbidity (usually 0.5 McFarland standard). This ensures consistency across tests.
3. Wash the bacterial cells with sterile saline or glycerol solution to remove residual media components that could interfere with reactions.

1. Inoculating the Test Strip

1. Rehydrate the test wells: Use the provided sterile saline or specific reagents to rehydrate each well if needed.
2. Inoculate each well: Dip a sterile loop or swab into the bacterial suspension, then carefully inoculate each well by transferring a few drops.
3. Ensure even distribution: Avoid overfilling or underfilling wells, as this can skew results.
4. Cover the strip: Seal the strip with a cover or place it in a humidified container to prevent dehydration.

1. Incubation

1. Place the inoculated strip in an incubator set at 30°C (or as specified).
2. Incubate for 24-48 hours: The optimal time depends on the expected bacterial growth and reactions.
3. Check periodically: Ensure humidity and temperature are maintained for consistent results.
