Signals are characterized by their amplitude, frequency, phase, and other parameters, which encode information.

What are Systems? Systems process signals to perform specific functions, such as filtering, amplification, modulation, or transformation. They can be:

- Linear or Nonlinear: Based on whether the principle of superposition applies.
- Time-Invariant or Time-Varying: Based on whether their characteristics change over time.
- Causal or Non-Causal: Depending on whether the output depends only on past and present inputs or future inputs as well.

Understanding these classifications helps engineers design and analyze systems effectively.
