Understanding the Answer Key for Basic Stoichiometry PhET Lab

The answer key is structured to provide step-by-step solutions to typical questions and tasks encountered during the simulation. While actual values may vary depending on the specific version of the lab, the core principles and calculation methods remain consistent.

1. Balancing Chemical Equations

Sample Question: Balance the following unbalanced equation: $\text{H}_2 + \text{O}_2 \rightarrow \text{H}_2\text{O}$ Answer: The balanced equation is: $2 \text{H}_2 + \text{O}_2 \rightarrow 2 \text{H}_2\text{O}$ Explanation: - Count atoms on each side. - To balance oxygen, place a coefficient of 2 before H_2O . - To balance hydrogen, place a coefficient of 2 before H_2 . - Final equation: $2 \text{H}_2 + 1 \text{O}_2 \rightarrow 2 \text{H}_2\text{O}$ Tip: Always start balancing atoms that appear in the fewest compounds.

2. Calculating Moles and Masses

Sample Question: If 4 grams of hydrogen gas (H_2) react with excess oxygen, how many grams of water (H_2O) are produced? Solution Steps: 1. Calculate moles of H_2 : $\frac{\text{mass}}{\text{molar mass}} = \frac{4 \text{ g}}{2 \text{ g/mol}} = 2 \text{ mol}$ 2. Use the mole ratio from the balanced equation ($2 \text{H}_2 : 2 \text{H}_2\text{O}$): $2 \text{ mol H}_2 \rightarrow 2 \text{ mol H}_2\text{O}$ 3. Moles of H_2O produced: $2 \text{ mol H}_2\text{O}$ 4. Convert moles of H_2O to grams: $\text{Mass} = 2 \text{ mol} \times 18 \text{ g/mol} = 36 \text{ g}$ Answer: 36 grams of water are produced.

3. Mole Ratios and Predicting Product Amounts

Sample Question: Given 3 mol of hydrogen and 2 mol of oxygen, which reactant is limiting, and how much water can be formed? Answer: - From the balanced equation: $2 \text{H}_2 + 1 \text{O}_2 \rightarrow 2 \text{H}_2\text{O}$ - Moles needed for 3 mol H_2 : - For oxygen: $\frac{1 \text{ mol O}_2}{2 \text{ mol H}_2} \times 3 \text{ mol H}_2 = 1.5 \text{ mol O}_2$ - Since 2 mol O_2 are available, oxygen is in excess. - Hydrogen is limiting because only 3 mol are available, which will produce: $\frac{2 \text{ mol H}_2\text{O}}{2 \text{ mol H}_2} \times 3 \text{ mol H}_2 = 3 \text{ mol H}_2\text{O}$ - Convert to grams: $3 \text{ mol} \times 18 \text{ g/mol} = 54 \text{ g}$ Conclusion: Hydrogen is limiting; 54 grams of water will be produced.

4. Identifying Limiting Reactants and Excess

Sample Scenario: You have 5 grams of sodium (Na) and 10 grams of chlorine gas (Cl_2). The reaction: $2 \text{Na} + \text{Cl}_2 \rightarrow 2 \text{NaCl}$ Answer: - Moles of Na : $\frac{5 \text{ g}}{23 \text{ g/mol}} \approx 0.217 \text{ mol}$ - Moles of Cl_2 : $\frac{10 \text{ g}}{70.9 \text{ g/mol}} \approx 0.141 \text{ mol}$ - From the balanced equation: $2 \text{Na} : 1 \text{Cl}_2$ - Na needed for 0.141 mol Cl_2 : $2 \times 0.141 = 0.282 \text{ mol}$ - Since only 0.217 mol Na are available, sodium is limiting. - Excess Cl_2 : $0.141 - \frac{0.217}{2} \approx 0.141 - 0.1085 = 0.0325 \text{ mol}$ Result: Na is limiting; the maximum NaCl produced is based on sodium, approximately 0.217 mol, which equals: $0.217 \text{ mol} \times 58.44 \text{ g/mol} \approx 12.7 \text{ g}$

5. Calculating Theoretical and Percent Yield

Sample Question: If the theoretical yield of NaCl is 12.7 g, but only 10 g is recovered after reaction, what is the percent yield? Answer: $\text{Percent yield} = \left(\frac{\text{actual yield}}{\text{theoretical yield}} \right) \times 100 = \left(\frac{10}{12.7} \right) \times 100 \approx 78.74\%$ Implication: This indicates some loss during the process, and students should analyze potential causes like incomplete reactions or losses during transfer.
