Sample Solved Surveying Problems and Solutions

Here, we present a selection of solved problems across categories to illustrate effective approaches and solutions.

1. Chain Surveying Problem

Problem: A chain of 30 meters is used to measure a boundary. The measured length is 30 m, but due to slack, the actual length is 30.2 m. Calculate the corrected length if the chain was slightly elongated by 0.1%. Solution: - Elongation = 0.1% of 30.2 m = $0.0001 \times 30.2 = 0.00302$ m - Corrected length = measured length - elongation = $30.2 \text{ m} - 0.00302 \text{ m} \approx 30.19698 \text{ m}$ Answer: The corrected boundary length is approximately 30.197 meters.

2. Compass Surveying Problem

Problem: Traverse ABCD has bearings: - AB = 100 m, bearing N 30° E - BC = 150 m, bearing S 45° E - CD = 120 m, bearing S 30° W - DA = 130 m, bearing N 60° W Calculate the closing error and adjust the bearings accordingly. Solution: - Convert bearings to azimuths. - Calculate the coordinates of each point. - Determine the closing error in East and North directions. - Adjust bearings proportionally. Due to the complexity, detailed calculations involve coordinate geometry and are typically handled with plotting or software.

3. Levelling Problem

Problem: The staff reading at station A is 2.5 m, and at station B, 4.2 m. The instrument is located at station A, and the instrument height is 1.5 m. Find the elevation of station B. Solution: - Height of B = Staff reading at B + height of instrument - Staff reading at A = $4.2 \text{ m} - 2.5 \text{ m} = 1.7 \text{ m}$ - Elevation of B = $1.7 \text{ m} + 1.5 \text{ m} = 3.2 \text{ m}$ Assuming elevation of A is known or set as zero.
