Sample Questions and Analytical Insights

Below are common types of questions found in the Pogil activity, accompanied by insights into their solutions as provided in the answer key.

1. Describing Dynamic Equilibrium Question:

Describe what is meant by dynamic equilibrium in a chemical system. Answer Key Explanation: Dynamic equilibrium occurs when the rates of the forward and reverse reactions are equal, resulting in no net change in the concentrations of reactants and products. Despite appearing static, both reactions continue to occur at the molecular level, maintaining a balance.

2. Writing the Expression for K Question: For the reaction $aA + bB \rightleftharpoons cC + dD$, write the expression for the equilibrium constant, (K). Answer Key Explanation: $K = \frac{[C]^c [D]^d}{[A]^a [B]^b}$ This expression signifies the ratio of product concentrations to reactant concentrations at equilibrium, each raised to the power of their stoichiometric coefficients.

3. Interpreting Graphs of Concentration vs. Time Question: Given a graph showing concentrations of reactants and products over time, identify when equilibrium is reached. Answer Key Explanation: Equilibrium is achieved when the concentrations of reactants and products become constant over time, indicated by the flat, horizontal segments of the graph. The point at which the lines level off marks equilibrium.

4. Applying Le Châtelier's Principle Question: What happens to the equilibrium position if the concentration of a reactant is increased? Answer Key Explanation: According to Le Châtelier's principle, increasing the concentration of a reactant shifts the equilibrium toward the products to counteract the change, resulting in a higher concentration of products at new equilibrium.

5. Calculating Equilibrium Concentrations Question: Given initial concentrations and the value of (K), calculate the equilibrium concentrations. Answer Key Explanation: Set up an ICE (Initial, Change, Equilibrium) table, express the equilibrium concentrations in terms of an unknown variable, and substitute into the (K) expression to solve for that variable. Once solved, determine all equilibrium concentrations.
