Classification of Air Masses: Types and Characteristics

Primary Categories of Air Masses

Air masses are classified based on their source regions and the properties they acquire from these regions. The main types include:

1. **Continental (c):** Originating over land, these air masses tend to be dry.
2. **Maritime (m):** Originating over water, these air masses are humid or moist.

Combining these two primary types gives four fundamental categories:

1. **cP (Continental Polar):** Cold, dry air masses from polar regions over land.
2. **cT (Continental Tropical):** Hot, dry air masses from tropical land areas.
3. **mP (Maritime Polar):** Cold, moist air masses from polar maritime regions.
4. **mT (Maritime Tropical):** Warm, moist air masses from tropical maritime regions.

Additional classifications can include:

1. **Equatorial (E):** Very warm, humid air from near the equator.
2. **Arctic (A):** Extremely cold air from the Arctic regions.

Characteristics of Major Air Mass Types

Understanding the specific traits of each air mass type helps students predict weather phenomena:

1. **cP (Continental Polar):** Cold, dry, stable, often causes clear skies and cold temperatures.
2. **cT (Continental Tropical):** Hot, dry, unstable, associated with heatwaves and dry conditions.
3. **mP (Maritime Polar):** Cool, moist, unstable, can bring fog, rain, and cooler temperatures.
4. **mT (Maritime Tropical):** Warm, moist, often leading to humid conditions, thunderstorms, and

precipitation.

Sources and Movements of Air Masses

Source Regions

Air masses acquire their temperature and humidity characteristics from their source regions, which are typically expansive areas with relatively uniform surface conditions. These regions include:

1. Polar regions (cold, dry or moist)
2. Tropical zones (warm, dry or moist)
3. Continental land areas (dry)
4. Maritime areas (moist)

Maps included in the worksheet often depict these regions, helping students visualize where different air masses originate.
