What Are Limiting and Excess Reactants?

Definition of Limiting Reactant

The limiting reactant is the substance in a chemical reaction that is completely consumed first, thus determining the maximum amount of product that can be formed. Once this reactant is used up, the reaction stops, regardless of the remaining quantities of other reactants.

Definition of Excess Reactant

The excess reactant is the substance that remains after the reaction has gone to completion because it is not completely consumed. It is present in a greater amount than necessary to react with the limiting reactant.

Importance of Identifying Reactants

Knowing which reactant is limiting and which is in excess allows chemists to: - Calculate theoretical yields - Determine the efficiency of a reaction - Optimize the use of reactants in industrial processes

Key Concepts in Limiting and Excess Reactants

Stoichiometry and Mole Ratios

Understanding the mole ratios from the balanced chemical equation is crucial. These ratios tell

you how many moles of each reactant are needed to produce a certain amount of product.

Calculating Limiting Reactant

The typical approach involves: 1. Converting all given reactant quantities to moles. 2. Using the mole ratios from the balanced equation to determine the amount of product each reactant can produce. 3. Identifying which reactant produces the least amount of product; this is the limiting reactant.

Determining Excess Reactant

Once the limiting reactant is identified, the remaining reactants are excess. The amount of excess reactant left over can be calculated by: - Using the mole ratio to find the amount that reacts with the limiting reactant. - Subtracting this from the initial amount to find the leftover.

Step-by-Step Approach to Pogil Activities on Limiting and Excess Reactants

Step 1: Write and Balance the Chemical Equation

Accuracy in balancing the equation is vital because all subsequent calculations depend on correct mole ratios.

Step 2: Convert Quantities to Moles

Convert given quantities (mass, volume, etc.) to moles using molar mass or molar volume.

Step 3: Use Mole Ratios to Find Theoretical Product

Calculate the amount of product each reactant can produce based on its initial amount.

Step 4: Identify the Limiting Reactant

Compare the amounts of product each reactant can produce; the smaller value indicates the limiting reactant.

Step 5: Calculate Remaining Excess Reactant

Determine how much of the excess reactant remains after the reaction completes.

Example Problem

Suppose 10 grams of hydrogen gas (H_2) reacts with 50 grams of oxygen gas (O_2) according to the reaction: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$ Determine the limiting reactant, the theoretical yield of water, and the amount of excess reactant remaining.

Solution Steps

1. Balance the Equation: Already balanced. 2. Convert to Moles: - Moles of H_2 : $(\frac{10}{2.016}, \text{g/mol}) \approx 4.96, \text{mol}$ - Moles of O_2 : $(\frac{50}{32.00}, \text{g/mol}) \approx 1.56, \text{mol}$ 3. Calculate Product Formation: - From the balanced equation, 2 mol H_2 reacts with 1 mol O_2 . - H_2 can produce: $(4.96, \text{mol}) \times \frac{2, \text{mol H}_2\text{O}}{2, \text{mol H}_2} = 4.96, \text{mol}$ - O_2 can produce: $(1.56, \text{mol}) \times \frac{2, \text{mol H}_2\text{O}}{1, \text{mol O}_2} = 3.12, \text{mol}$ 4. Identify Limiting Reactant: - Since O_2 produces fewer moles of water (3.12 mol), oxygen is the limiting reactant. 5. Calculate Theoretical Yield of Water: - The maximum water produced is 3.12 mol. - Convert to grams: $(3.12, \text{mol}) \times 18.015, \text{g/mol} \approx 56.2, \text{g}$ 6. Calculate Remaining Excess Reactant: - H_2 used: $(3.12, \text{mol}) \times \frac{2, \text{mol H}_2}{1, \text{mol O}_2} = 6.24, \text{mol}$ - Remaining H_2 : $(4.96, \text{mol}) - 6.24, \text{mol}$ (but since initial H_2 is only 4.96 mol, all H_2 reacts with O_2 , so none remains) - Excess reactant O_2 : initially 1.56 mol; all O_2 is consumed in limiting reactant scenario, so no excess O_2 remains. Answer Summary: - Limiting Reactant: Oxygen (O_2) - Theoretical Yield of Water: Approximately 56.2 grams - Remaining Reactant: No excess reactant remains
