Creating Your First Simulation in ANSYS Maxwell

Step 1: Setting Up the Geometry

The foundation of any electromagnetic simulation is an accurate geometry model. ANSYS Maxwell allows you to create geometries either from scratch using built-in drawing tools or by importing CAD files (e.g., STEP, IGES, DXF formats). Consider the following when preparing your geometry:

1. Ensure that the geometry accurately reflects the real-world device or component.
2. Simplify complex geometries where possible to reduce computational load.
3. Define material regions clearly for different parts of the model.

Step 2: Assigning Materials

Material properties are vital for realistic simulations. Maxwell includes extensive material libraries, but custom materials can be added as needed. Assign materials to different geometric regions by selecting the region and choosing the appropriate material from the library or defining new material properties such as permeability, permittivity, conductivity, etc.

Step 3: Defining Boundaries and Excitations

Proper boundary conditions and excitations ensure the simulation accurately reflects physical conditions. Common boundary types include:

1. Perfect Electric Conductor (PEC)
2. Perfect Magnetic Conductor (PMC)
3. Symmetry boundaries
4. Radiation boundaries

Excitations such as voltage sources, current sources, or magnetic coils can be applied depending on your design requirements.

Step 4: Meshing the Model

Meshing subdivides the geometry into small elements for numerical analysis. ANSYS Maxwell offers automatic and manual meshing options. Key points include:

1. Use finer meshes in regions with high field gradients.
2. Control mesh size through global or local mesh settings.
3. Verify mesh quality to prevent convergence issues.

Step 5: Running the Simulation

After setting up your geometry, materials, boundary conditions, and mesh, you can run the simulation. Choose the appropriate analysis type:

1. **Static (DC):** For static magnetic or electric fields.
2. **Frequency Domain:** For AC analysis, impedance, and S-parameters.
3. **Transient:** For time-varying fields and transient responses.

Click the "Analyze" button to start the simulation. Monitor progress and review logs for any errors or warnings.
